## Dilutional Linearity

- Samples from 7 apparently healthy donors were diluted in Calibrator Diluent

$$
\% \text { recovery }=\frac{(\text { measured value } * \text { dilution factor } * 100)}{\text { predicted value }}
$$

- IX dilution refers to the dilution recommended for serum, i.e. a IO-fold dilution

| Dilution <br> Factor | Percent Recovery <br> $(\%)$ |
| :---: | :---: |
| 2 X | 102 |
| 0.5 X | 98 |
| 0.25 X | 96 |

Spike Recovery

- Measured analyte spiked into apparently normal human samples

$$
\% \text { recovery }=\frac{(\text { measured spiked value }- \text { measured native })}{\text { spike }}
$$
